MI Paste® ONE Perio
One Step Anti-Gingivitis Toothpaste with RECALDENT® Technology

The significant choice in anti-gingivitis toothpaste!
MI Paste ONE® Perio & The MI Paste® Family

MI Paste® products are the essential solutions which release calcium, phosphate, and fluoride. They are the first of their kind – containing naturally derived milk protein and fluoride for safe and effective treatment of white spot lesions, non-cavitated tooth demineralization, sensitivity and now gingivitis.

The effective delivery vehicle for Fluoride

When fluoride is used with RECALDENT® (CPP-ACP), the peptide preferentially combines with, and stabilizes, fluoride to create the ideal source for building fluorapatite. Using bio-available calcium and phosphate, the full potential of fluoride to help protect and repair teeth can be achieved.

How to Use

1. Apply a small, pea-size amount of MI Paste® One Perio to your toothbrush.
2. Brush for 2 minutes, expectorate and avoid rinsing and eating or drinking for 30 minutes after brushing. Use twice daily.

MI Paste® ONE Perio provides:

- A range of therapeutic benefits
- Long lasting anti-biofilm efficacy to prevent and help recovery from gingivitis
- Bio-available calcium, phosphate and fluoride to promote remineralization and relieve sensitivity

MI Paste® ONE Perio
Contains: 10 tubes (42g each)
437300 Fresh Mint

Remineralization

Remineralization of human enamel slab was measured by in situ study.

Combination of RECALDENT® (CPP-ACP) + SnF₂ showed highest remineralization effect.

Suitable for perio patients (anti-gingivitis)

Suppression of bacterial re-growth

Saliva based multi-species biofilm was cultured for 24 hrs. Supernatant of centrifuged 10-fold diluted paste was applied on the biofilm for 10 min. Bacterial metabolic activity after re-growth was measured by AlamarBlue assay.
